

Businesses face many hazards in the supply chain – from the current Pandemic, Cyber threats and Fraud, to regulatory compliance.

“ With longer and more complex supply chains exacerbating risks, how do you ensure your supply-chain is secure? ”

Supply Chain Assurance POC

Modern supply chains operate within a network of multiple businesses and relationships - the supply chain is not normally a simple chain of businesses with one-to-one relationships.

Simplicity can be a complicated matter. From a supply-chain perspective, companies must scrutinize their processes, to clean out the 'clutter' that tends to build up across organisations and data.

Methods End-To-End Proof of Concept:

Examines the vulnerability of an organisation's supply chain network

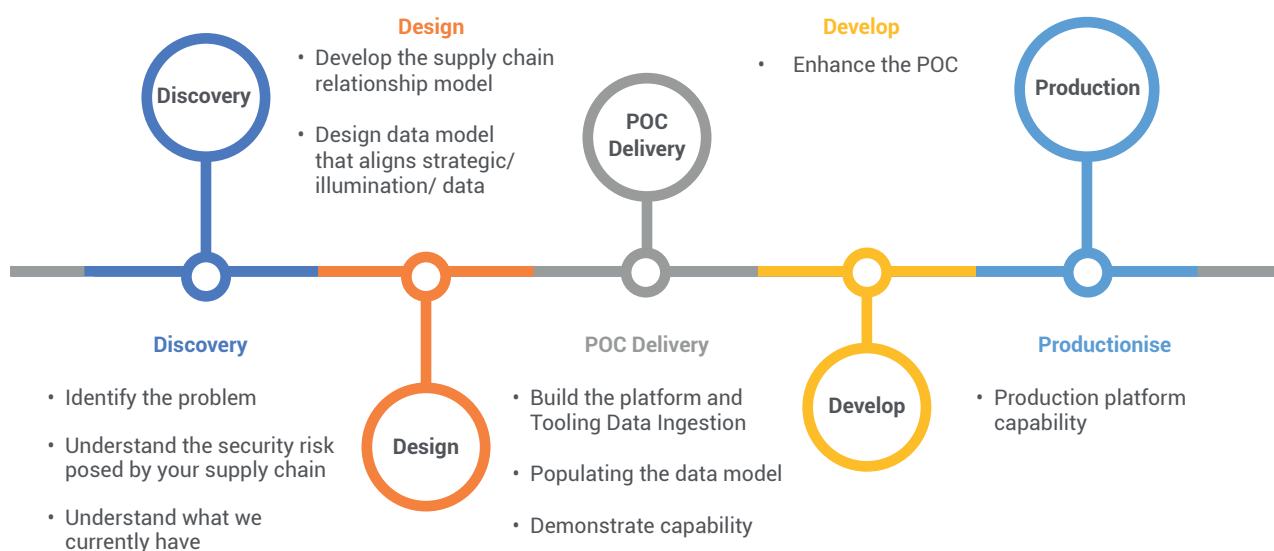

Identifies risks and weaknesses

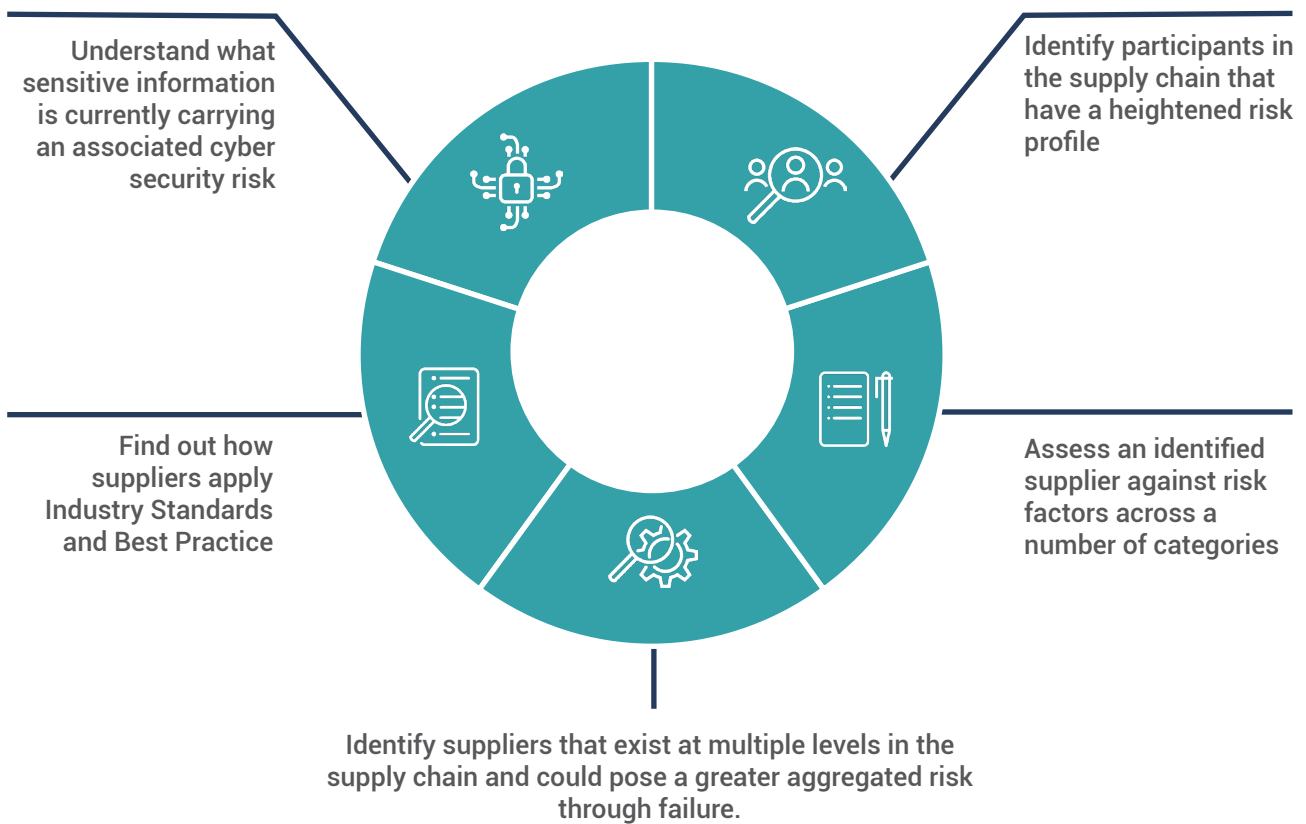

Produces mitigation strategies and corrective action plans as part of managing risk in procurement

Phased Approach

Many companies use multiple spreadsheets to manage supply chains; this approach is often fragmented and hard to maintain.

Outcomes & Benefits

Our guiding principles should be visibility of inventory and collaboration with supply-chain partners. Everyone benefits from the exercise.

The supply Chain cannot be managed in isolation, it must be managed in a coordinated effort across internal and external relationships.

By understanding supplier risk, emerging issues become evident and organisations need to be prepared for this.
