Case study

National Shielding Service

Background

During the Covid-19 pandemic the UK Government needed to establish a mechanism for supporting clinically extremely vulnerable people who needed additional support to access food and social care whilst shielding at home

The challenge

A rudimentary service was quickly developed by GDS to satisfy immediate needs using effective but short-term technology choices, incurring extensive technical debt. Further work was required to develop and maintain the service throughout lockdown:

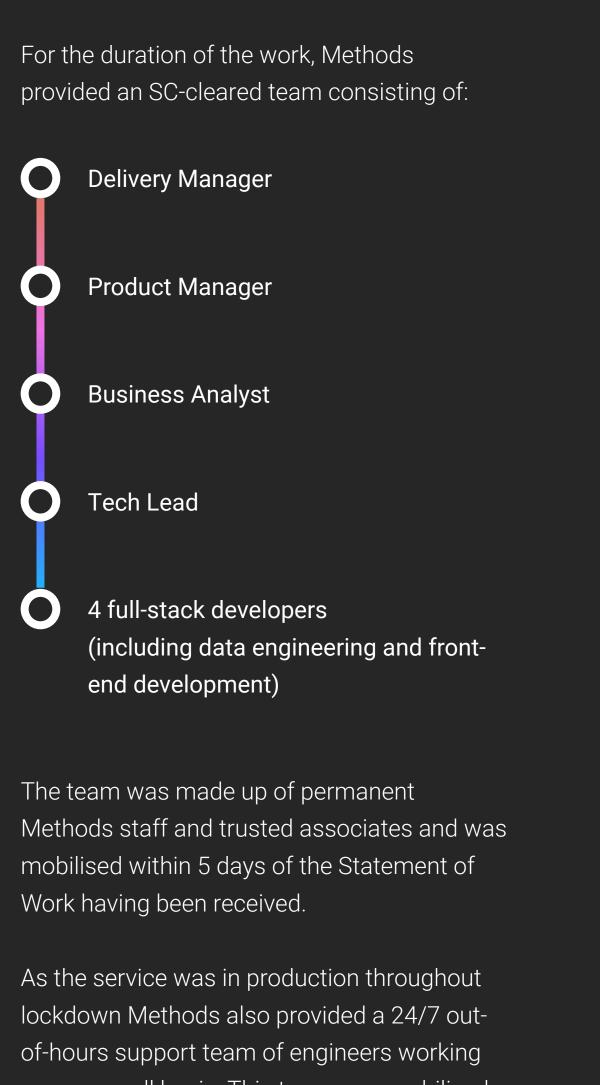

> Developing the service so it would be ready for a potential second wave

Remediating technical debt gradually throughout development

Working with changing policy Supporting local lockdowns, adapting the service and engaging priorities and tight deadlines to with leads within central and local respond to the urgent and changing government to understand the nature of the pandemic. policy landscape

Collaborating across a large number of organisations

The team we put in

on an on-call basis. This team was mobilised within 10 days.

How we went about the work

Initially Methods supported the development, delivery and maintenance of the service for Shielding Vulnerable People, integrating with GOV.UK Notify to send notifications to citizens registering for assistance.

The Shielding Team was made up of in-house Civil Servants and other suppliers, such as Newton Europe and Thoughtworks. Although working remotely, Methods promoted a 'One Team' Ethos through:	The work was delivered ite methodology, and to help t remotely, we ensured use o as Google Meet, Teams, Sl

Food charities

What we delivered

Anticipating the Autumn second wave we introduced a robust but flexible solution, based on a scalable architecture, developed iteratively incorporating feedback from user testing.

This seamlessly replaced the previous version, while also being able to accommodate changing policy. Enhancements included:

An account component	Delivering an account component to enable users to return and update their information - NHS log in
Relational database	Migrating to a relational database to ensure data was stored and structured appropriately, enabling the team to better react to cha and make it easier for service providers to consume the service of
Quality of data	Improving the quality of address data to ensure data was being p to the right service providers (local authorities)
User support tools	Developing tools for the user support team so they could quickly respond to customer and stakeholder queries without having to gengineers to do database lookups
Management processes	Implementing robust incident management processes and out or hours support for the service

These enhancements ensured the service could better respond to rapid policy changes, allowing for support during local lockdowns such as that in Leicester.

Outcome

In its first 4 months 2.2 million people were contacted, with 1.2 million people signing up to the website. The service enabled the delivery of over 4.7 million essential supplies to over half a million people who were at the highest risk from Covid-19.

The service passed an internal GDS Beta assessment and went on to win a Civil Service Award, recognising the 'unprecedented collaboration with DHSC, the Government Digital Service, the Department for Work and Pensions, the Department for the Environment, Food and Rural Affairs, the Cabinet Office, NHSE and NHS Digital'.
